RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 24 pages. Original publisher: Washington, D. C. : National Aeronautics and Space Administration ; Springfield, Va. : For sale by the National Technical Information Service, 1990 OCLC Number: (OCoLC)25321965 Subject: Silica. Excerpt: . . . larger samples used, 20 g versus about 17 mg (TGA) In the incremental analysis. A cause for these minor discrepancies in the two char yields maybe due to small variations in composition of the TEOS-A samples from batch to batch. Application Evaluation Now that we have some background data on the chemistry and some important physical properties of TEOS-A and TEOS-B, we are in a position to present examples of the potential use of these materials in actual ceramic processing. The sticky, adhesive properties of TEOS-A imply its use as a binder for ceramic oxide powders for the fabrication of ceramic articles. In most cases, organic polymers are used for this purpose, but an inherent objection to purely organic binders is that their binding properties are lost after burn off and before sintering; thus, compacts of poor mechanical strength are produced. In contrast to the organic polymers which leave no char residue after firing, polysiloxanes derived from TEOS-A binder deposit active amorphous silica between the oxide particles which allows reaction bonding via silicate formation at a relatively low temperature; thus, the compacts remain intact up to and after the final firing sequence. In addition, the use of polysiloxane polymers, because of their significant silica char formation, should cause less pyrolytic shrinkage than an equal amount of a zero char yield organic binder. The complete loss of organic binders as volatile organic compounds shows up as a large weight loss, plus shrinkage and or porosity. For this first application, we chose Corning 7913...
